

# Step by step guide

**Step 1: Purchasing an RSSEO! membership**

**Step 2: Download RSSEO!**

**2.1 Download the component**

**2.2 Download RSSEO! language files**

**Step 3: Installing RSSEO!**

**3.1 Installing the component**

**3.2 Minimum requirements**

**3.3 Installing the language files**

**Step 4: Update RSSEO! to a newer version**

**4.1 - Using the “Updates” tab**

**4.2 - Using the default Joomla! installer**

**Step 5: RSSEO! settings**

**5.1 General settings**

**5.1.1 Add the license code**

**5.1.2 Date format (optional)**

**5.1.3 Enable debug**

**5.2 “Seo Performance” settings**

**5.3 Crawler settings**

**5.4 Replacement options**

**5.5 Subdomains**

**5.6 cURL settings**

## **5.7 Keyword density settings**

### **Step 6: Crawl the Joomla! website**

### **Step 7: Optimize your Joomla! website**

#### **7.1 Optimize pages**

##### **7.1.1 Optimize titles**

###### **7.1.1.1 Title tag length**

###### **7.1.1.2 Duplicate title tags**

##### **7.1.2 Optimize meta keywords**

##### **7.1.3 Optimize meta description**

###### **7.1.3.1 Meta description tag length**

###### **7.1.3.2 Duplicate meta description**

##### **7.1.4 Optimize images**

###### **7.1.4.1 Images without the height or width attribute**

##### **7.1.5 Keywords density tool**

##### **7.1.6 Optimize page speed and page loading time**

##### **7.1.7 Optimize headings**

##### **7.1.8 Optimize internal links**

###### **7.1.8.1 Search engine friendly URLs**

###### **7.1.8.2 Add anchor text to links**

###### **7.1.8.3 Check for internal/external links**

#### **7.2 Keywords**

##### **7.2.1 Optimize keywords**

##### **7.2.2 Monitor keyword position**

#### **7.3 Add redirects (optional)**

### **Step 8: Submit a sitemap to search engines**

#### **8.1 Why use a XML sitemap?**

- 8.2 Enable canonicalization**
- 8.3 Generate sitemaps with RSSEO!**
  - 8.3.1 Generate XML sitemaps**
  - 8.3.2 Generate HTML sitemaps**
- 8.4 Submit the sitemaps to search engines**
  - 8.4.1 Submit the sitemap to Google**
    - 8.4.1.1 Verify the siteownership for Google Webmaster Tools**
    - 8.4.1.2 Submit the sitemap**
  - 8.4.2 Submit the sitemap to Yahoo!**
    - 8.4.2.1 Verify the siteownership for Yahoo!**
    - 8.4.2.2 Submit the sitemap**
  - 8.4.3 Submit the sitemap to Bing**
    - 8.4.3.1 Verify the siteownership for Bing**
    - 8.4.3.2 Submit the sitemap**
- Step 9: Monitor and compare the SEO performances**
  - 9.1 Add new competitors**
- Step 10: Google Analytics Integration**

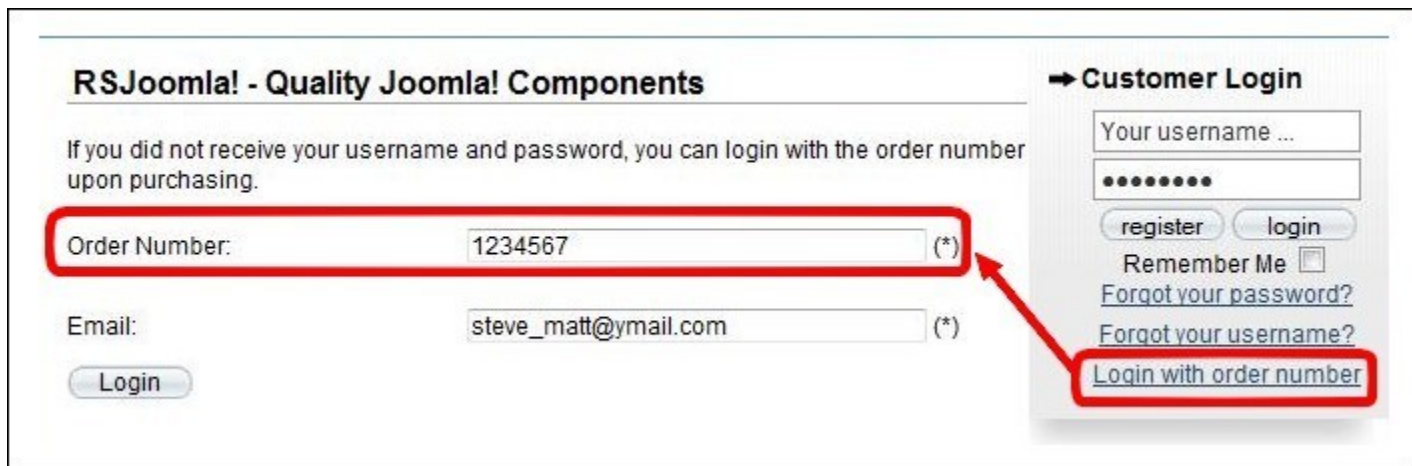

## Step 1: Purchasing an RSSEO! membership

Once you have purchased an RSEvents! membership, an RSJoomla! account is automatically created and an email is sent to you along with your account details.

Upon transaction, users have 2 ways of accessing the [www.rsjoomla.com](http://www.rsjoomla.com) account and download RSSEO!:

1. Login with the user and password automatically created and sent via email, during the transaction process, using the **Customer Login** form.
2. Login with the order number received on the user email.

### Login with the order number

The screenshot shows the RSJoomla! Customer Login interface. On the left, under the heading "RSJoomla! - Quality Joomla! Components", there is a message: "If you did not receive your username and password, you can login with the order number upon purchasing." Below this, there are two input fields: "Order Number:" with the value "1234567" and "Email:" with the value "steve\_matt@ymail.com". A "Login" button is positioned below the email field. On the right, under the heading "Customer Login", there are fields for "Your username ..." and a password field (represented by dots). Below these are "register" and "login" buttons, a "Remember Me" checkbox, and links for "Forgot your password?" and "Forgot your username?". A red box highlights the "Login with order number" link, and a red arrow points from this link to the "Order Number" input field.

## Step 2: Download RSSEO!

### 2.1. Download the component

To download RSSEO! you need to:

**Step 1:** login on <http://www.rsjoomla.com> with the user details or the order number received on email.

**Step 2:** in the right side, you will find a section dedicated to RSJoomla! customers: **Customer Login**. Click on **View my downloads**

**Step 3:** In the **Customer downloads** section are listed all the user's memberships. Click on **Downloads >> RSSEO! Files >> Component >> Download RSSEO! for Joomla! 1.5**

Customer Downloads						
#	Membership	Files	Licenses	Started	Expires	Status
1	<a href="#">RSSEO! 1 Domain Lifetime</a>	<a href="#">Downloads</a>	<a href="#">Licenses</a>	17.09.2010 05:04:13	Unlimited	Active

## 2.2. Download RSSEO! language files

Additionally, if you need RSSEO! translated in other languages, you can download the available RSSEO! language files from **Customer Downloads > RSSEO! Files > Languages** or [create your own language files](#).

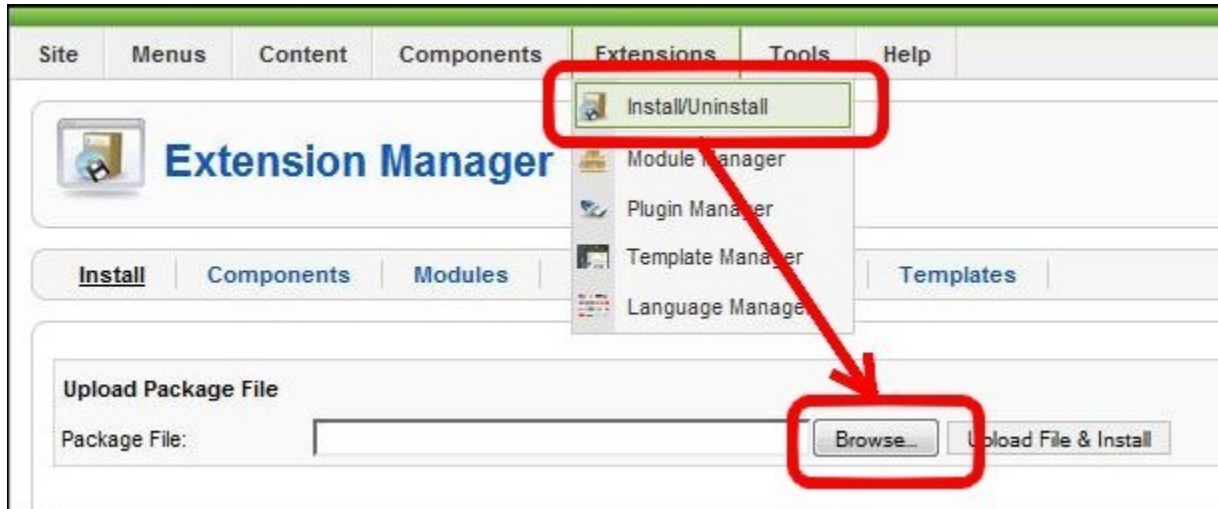

Available files:	
	Name
	..
	<a href="#">Dutch</a>
	<a href="#">English</a>
	<a href="#">swedish.zip</a>

## Step 3: Installing RSSEO!

### 3.1: Installing the component

RSSEO! installs like any other component - through the default Joomla! installer.

In the backend panel, head to **Extensions >> Install/Uninstall >> Browse RSSEO! from your computer >> Upload File & Install.**

### 3.2 Minimum requirements

- You must ensure that you have MySQL, XML and zlib functionality enabled within your PHP installation.
- **Please make sure your hosting provider allows loopback connections** via one of the following Apache extensions or functions : cURL , fsockopen , fopen , file\_get\_contents. - **RSSEO! uses the above functions to connect to your website's address.**

#### Test the connectivity:

RSSEO! uses any of the following functions: *cURL* , *fsockopen* , *fopen* , *file\_get\_contents*, from which only one is required in order for the crawler to work properly.

If your hosting provider doesn't allow these functions, check the second option from the "[Recommended workflow](#)" area.

There are 2 ways to check these functions:

- right after installing RSSEO!, click on the “Test connectivity” button

- in the Joomla! backend panel, head to **Components >> RSSEO! >> Control Panel** ; on the RSSEO! control panel, click on the “Check Connectivity” icon from the right side

## Recommended workflow:

### Option 1: Loopback connections via cURL, fsockopen, fopen or file\_get\_contents

This is part of the RSSEO! minimum requirements: to be able to run RSSEO! you must have enabled at least one of the following functions **cURL** , **fsockopen** , **fopen** , **file\_get\_contents**. In case your hosting provider doesn't allow loopback connections, then head to the second option.

### Option 2: Your server does not accept loopback connections, but allows you to use the exec function

Many hosting providers that restrict the usage of the loopback connections will allow the use of the PHP [exec function](#), to execute external programs.

Although the installation of RSSEO! remains basically the same when using this function, there are some additional steps to go through: you need to download the **indexseo.php** file from your RSJoomla! account, unzip it, copy the file in the root Joomla! installation folder and modify the crawler settings from the Joomla! backend panel.

1. Download the **indexseo.php** file: **View my downloads >> Component >> New index file for "exec" use**
2. Unzip the downloaded file
3. Place the indexseo.php file into your **root** Joomla! installation folder
4. After the RSSEO! component installation, go to Components > RSSEO! > Settings > Crawler and set the **PHP command** option as follows:
  - for servers that run *Linux* as an operating system, just type in **"php"**
  - for servers that run *Windows* operating system, type in the path to the **php executable** file (*php.exe*), for example: *C:\php\php.exe*

If the hosting provider does not allow the use of *exec*, you can use the third option.

### Option 3: proxy cURL connect

If you can't use neither loopback connections nor the *exec* function, you can connect through cURL (requires the cURL function to be enabled) with proxy. The advantage of using proxy is that the page content requests won't be made anymore through the loopback connections or the *exec* function, but by another server.

### 3.3: Installing the language files

The language files install same as the component - through the default Joomla! installer (see the above screenshot), the only condition in order to work is to have previously installed the Joomla! languages pack for frontend and backend.

- 1. Install the Joomla! languages pack** (if there aren't already installed):
  - a. Head to [Joomla! language packs area](#) and choose the desired translation.
  - b. Download the corresponding Joomla! languages pack for frontend and backend.
  - c. Install the Joomla! languages pack (regular installation through the Joomla! installer): in the backend panel head to **Extensions >> Install/Uninstall >> Browse the Joomla! language files >> Upload and Install**
    - e.g. If you want to use RSSEO! in Dutch, first install the Dutch Joomla! languages pack for frontend and backend, from <http://joomlancode.org>
      - `nl-NL_joomla_lang_site.1.5.20.zip`
      - `nl-NL_joomla_lang_admin.1.5.20.zip`
- 2. Install the RSSEO! languages pack:** (regular installation through the Joomla! installer)
  - a. Download the RSSEO! language files from <http://www.rsjoomla.com> - Customer Downloads (see [Step 2.2 Download RSSEO! language files](#))
  - b. In the backend panel, head to **Extensions >> Install/Uninstall >> Browse the RSSEO! language files >> Upload**

## Step 4: Update RSSEO! to a newer version

RSSEO! has an **“Updates”** tab, especially designed to smooth the update process. There are 2 ways to update the RSSEO! Component:

### 4.1 - Using the “Updates” tab :

To be able to receive updates directly in the Joomla! backend panel, you need to enter the RSSEO! license codes.

#### Step 1:

To get this license code, login to your RSJoomla! account and click on the Licenses link from the Customer Downloads section

Customer Downloads						
#	Membership	Files	Licenses	Started	Expires	Status
1.	<a href="#">RSSEO! 1 Domain Lifetime</a>	<a href="#">Downloads</a>	<a href="#">Licenses</a>	17.09.2010 05:04:13	Unlimited	Active

### Step 2:

After adding the domain name, a license code is generated.

Copy the license code and paste it in the RSSEO! control panel from the backend Joomla!

RSSEO!1.0.0 REV 9

Installed Version	1.0.0
Copyright	@2007-2010 www.rsjoomla.com
License	GPL License
Author	www.rsjoomla.com

Please enter your code to receive updates:

MYLICENSECODE

### Step 3:

Whenever you want to check new RSSEO! updates, in the administrator panel head to **Components >> RSSEO! >> Updates** and you will be able to download the component directly from the backend.

Overview
SEO Performance
Pages
Redirects
Sitemap
Crawler

**Checking for updates**

**1.** RSSEO! 1 Domain Lifetime Your version is up to date. No new downloads are available.

## 4.2 - Using the default Joomla! installer:

Download RSSeo! from your **RSJoomla! account** >> **View my downloads**.

In the Joomla! backend panel head to **Extensions** >> **Install/Uninstall** >> **Browse the RSSeo! pack** >> **Upload**.

## Step 5: RSSeo! settings

Path: **Joomla! backend panel** >> **Components** >> **RSSeo!** >> **Settings**

The **Settings** tab represents the general RSSeo! configuration panel. You can configure here the “Seo Performance” and the “Crawler” tab, as well as other general settings like heading replacements, subdomains and cURL.

### 5.1 General settings

#### 5.1.1 Add the license code

Here you can add your **license code** generated in your RSJoomla! account so you can receive updates and download new RSSeo! versions directly from the backend. (For more information about the license code and the update process see [Step 4: Update RSSeo! to a newer version](#))

#### 5.1.2 Date format (optional)

RSSeo! date format is configured by default.

In case you would like to modify these settings, the **date format** allows you to set a single central point of configuration for dates that will be used throughout RSSeo!. This is essentially a mask that will be applied to all RSSeo! stored dates. A complete list of usable mask is available [here](#).

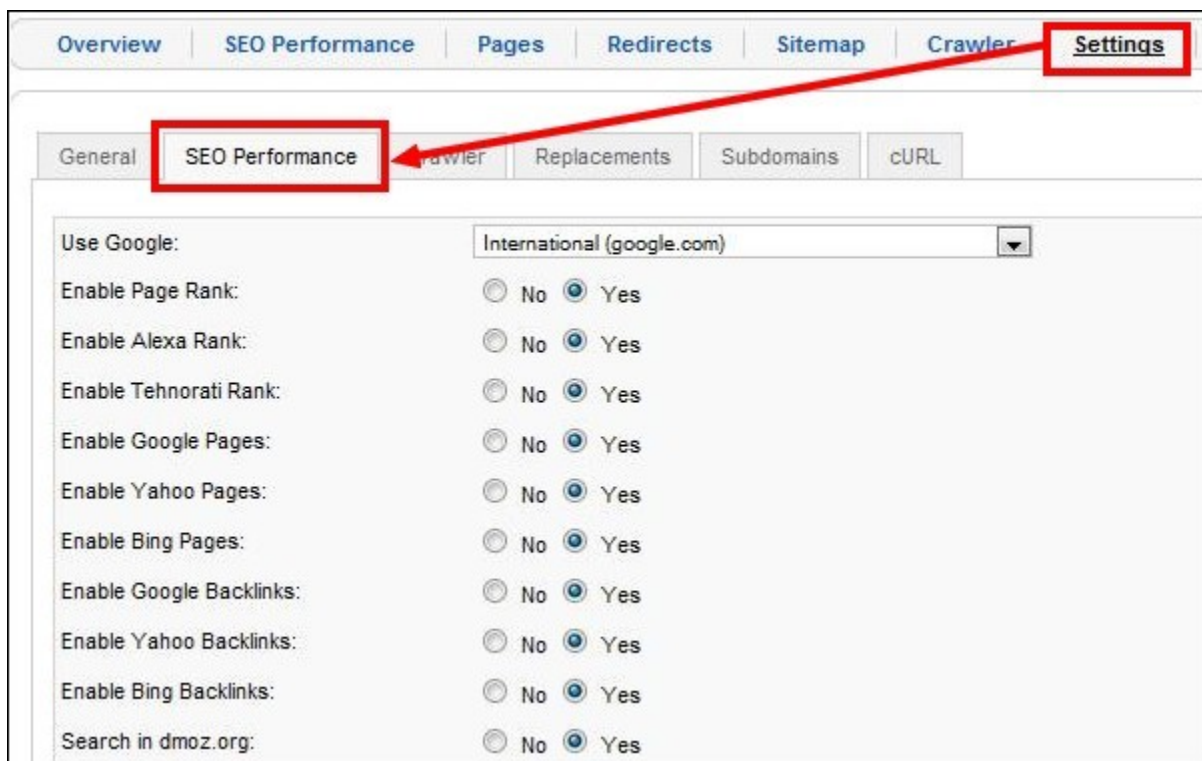

By default, the *d M y H:i* mask is used.

### 5.1.3 Enable debug

By default this option is disabled. You can enable it to view potential errors or warning messages.

## 5.2 “Seo Performance” settings

Here you can configure what SEO performances should RSSEO! monitor in the “Seo Performances” tab: the Page Rank, Alexa Rank and Technorati Rank, Google Yahoo! and Bing indexed pages and backlinks, and the [dmoz.org](http://dmoz.org) site submission.

You can enable/disable the following SEO performances:

#### **Use Google:**

- when the **International option** is selected, RSSEO! displays in the “**Keywords**” tab the keyword position as shown in the Google International SERP (search engine results page);
- when a **Local option** is selected (e.g. **google.nl**), RSSEO! displays in the “**Keywords**” tab the keyword position as shown in the Regional Google SERP (search engine results page);

**Enable Page Rank:** displays in the “Seo Performances” tab, your website and your competitors Page Rank

**Enable Alexa Rank:** displays in the “Seo Performances” tab, your website and your competitors Alexa Rank

**Enable Tehnorati Rank:** displays in the “Seo Performances” tab, your website and your competitors Page Rank

**Enable Google Pages:** displays in the “Seo Performances” tab, your website and your competitors Google indexed pages

**Enable Yahoo Pages:** displays in the “Seo Performances” tab, your website and your competitors Yahoo! indexed pages

**Enable Bing Pages:** displays in the “Seo Performances” tab, your and your competitors Bing indexed pages

**Enable Google Backlinks:** displays in the “Seo Performances” tab, the incoming links to your and your competitors websites as shown in Google

**Enable Yahoo Backlinks:** displays in the “Seo Performances” tab, the incoming links to your and your competitors websites as shown in Yahoo!

**Enable Bing Backlinks:** displays in the “Seo Performances” tab, the incoming links to your and your competitors websites as shown in Bing

**Search in dmoz.org:** verifies if your website or your competitors websites have been published in the human edited directory, [dmoz.org](http://dmoz.org)

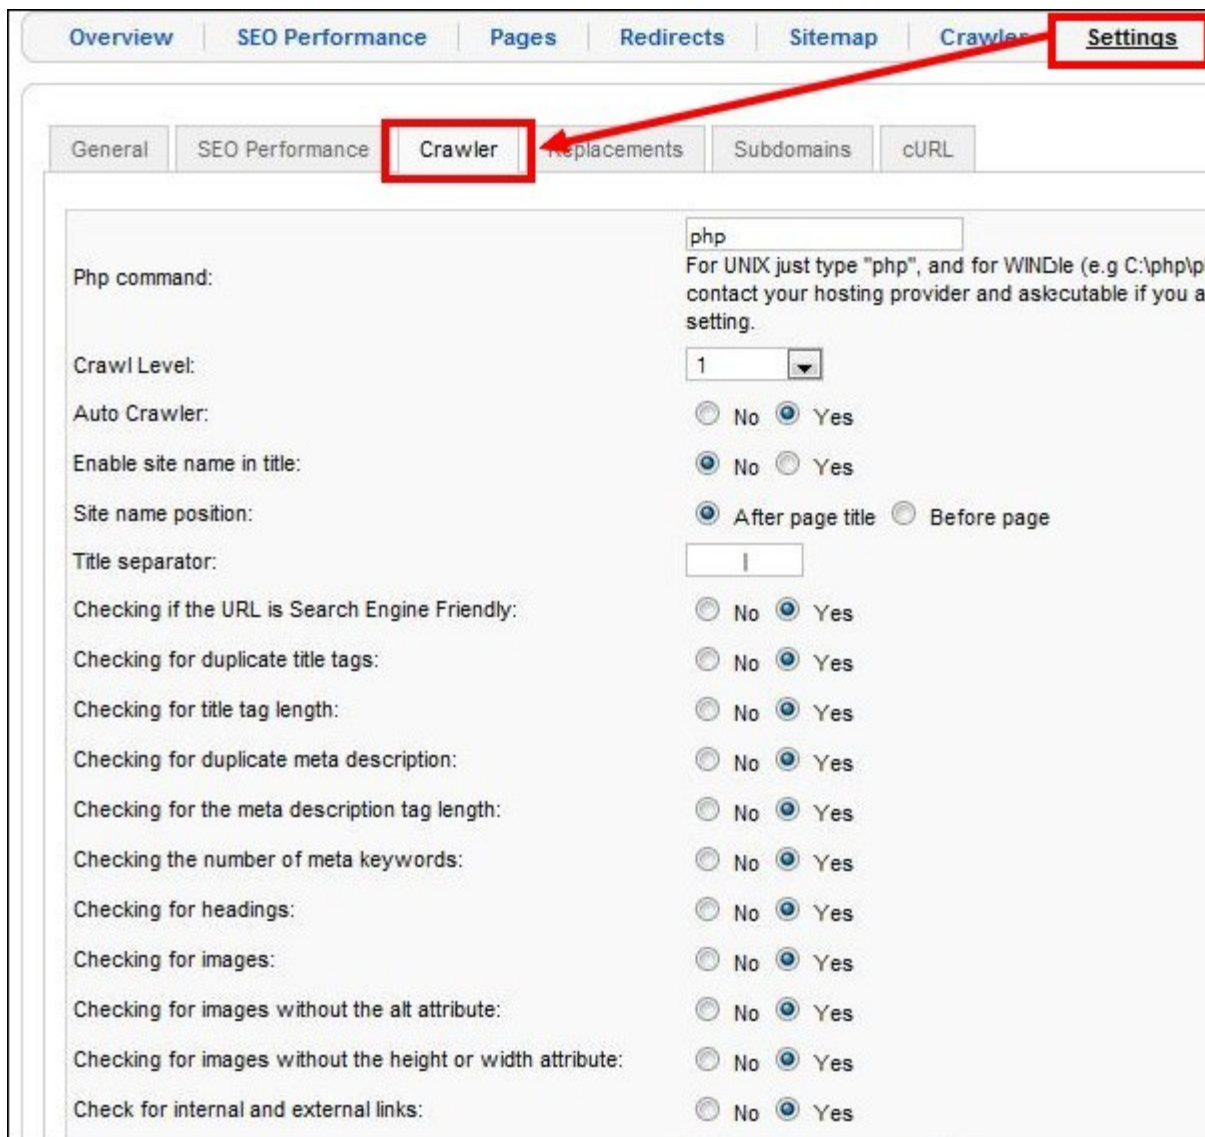

**Notice:**

- the keyword position may vary based on several factors: universal or local search (a certain keyword may be in the 5-th position in the [google.com](http://google.com) index and in the first [google.nl](http://google.nl) position), personalized search and search engines restrictions.

### 5.3 Crawler settings

Here you can configure some general crawler settings and what on-page seo factors should RSSeo! check when crawling the website pages: internal/external links, titles, meta description and meta keywords, headings, and images.

**Php command:** this is required when using RSSEO! via the the PHP exec function. See [option 2 from the Recommended Workflow area](#).

**Crawl Level:** you can set the crawler only to go to a specified level, the frontpage being considered level 0. For each link that is found on the frontpage the crawler will reinitialize, thus achieving level 1, and so on.

By default, RSSEO! crawls pages until it reaches level 1; however, if you want to crawl the entire Joomla! website, you must set the crawler to **“Unlimited”**.

**Auto Crawler:** when the auto-crawler option is enabled, RSSEO! detects new pages and automatically crawls them and includes them .  
By default, this option is enabled in RSSEO!

**Enable site name in title:** if this option is checked, it will show the site name on all website titles.

**Site name position:** if the above option is enabled, it will display the site name after or before the page title.

**Title separator:** set the title separator character. By default, the title separator is the pipeline character “|”.

**Checking if the URL is Search Engine Friendly**

**Checking for duplicate title tags**

**Checking for title tag length**

**Checking for duplicate meta description**

**Checking for the meta description tag length**

**Checking the number of meta keywords**

**Checking for headings**

**Checking for images**

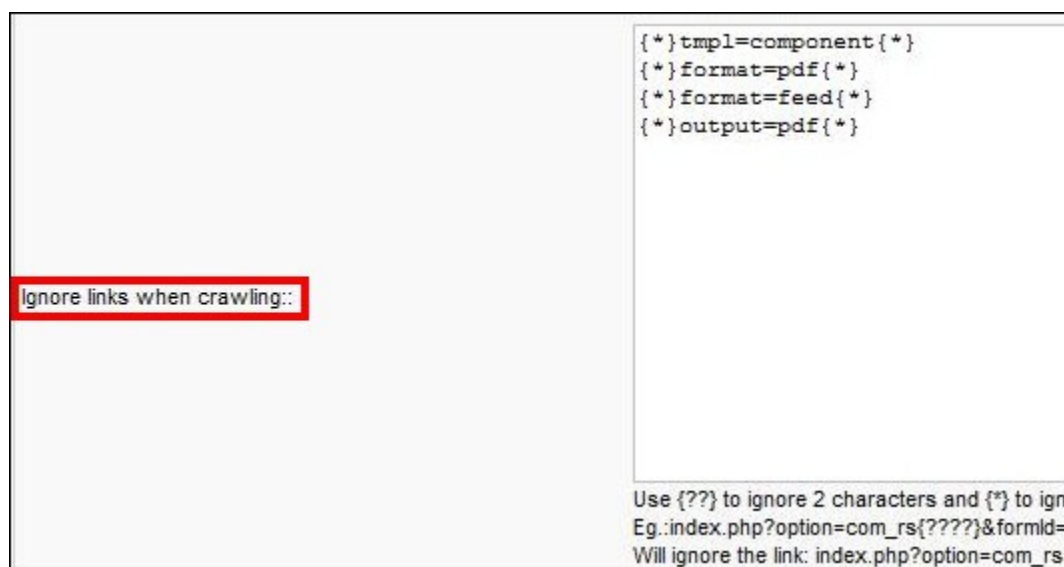

**Checking for images without the alt attribute**

**Checking for images without the height or width attribute**

**Check for internal and external links**

**Ignore links when crawling:** you can set the crawler to ignore certain links by replacing URL characters with the `{*}` wildcard.

*e.g. to ignore links that include "tmpl=component" use `{*}tmpl=component{*`, where the `{*}` wildcard replaces all characters before and after "tmpl=component".*

The screenshot shows a configuration window with a text input field labeled "Ignore links when crawling:". The field contains the following wildcards:

```
{*}tmpl=component{*}  
{*}format=pdf{*}  
{*}format=feed{*}  
{*}output=pdf{*}
```

Below the input field, there is explanatory text: "Use {??} to ignore 2 characters and {\*} to ignore any number of characters. Eg.: index.php?option=com\_rs{????}&formid=... Will ignore the link: index.php?option=com\_rsf..."

## 5.4 Replacement options

Joomla! uses 2 heading classes “**componentheading**” and “**contentheading**” to emphasize text and important ideas across a page, instead of the html tags <h1>, <h2>, <h3>, <h4>, <h5> and <h6>.

These html tags are an important on-page seo factor, therefore it is recommended to allow RSSeol to replace the Joomla! heading classes with <h1>, ... , <h6>.

The screenshot shows the RSSeol Settings interface. The top navigation bar includes tabs for Overview, SEO Performance, Pages, Redirects, Sitemap, Crawler, and Settings. The Settings tab is selected and highlighted with a red box. Below this, a sub-navigation bar contains tabs for General, SEO Performance, Crawler, Replacements, Subdomains, and cURL. The Replacements tab is also highlighted with a red box. A red arrow points from the Settings tab to the Replacements tab. The main content area shows the following settings:

- Enable Keyword Replacement:  No  Yes
- Keyword delimiters:
- Replace "componentheading" with:  (dropdown)
- Replace "contentheading" with:  (dropdown)

### Tip:

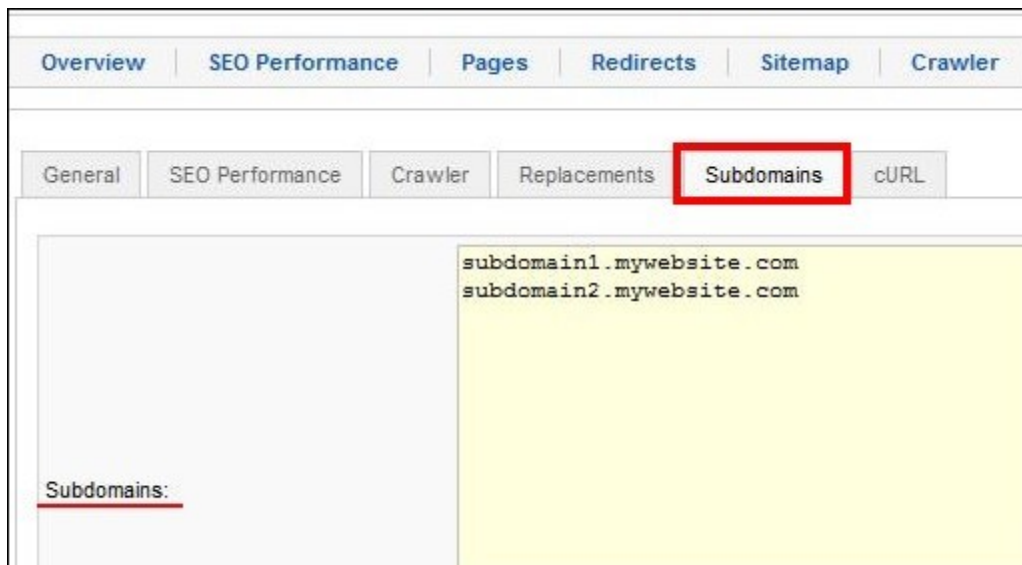

- Allow RSSeol to replace the Joomla! heading classes “**componentheading**” and “**contentheading**” with the html tags <h1>, ... , <h6>

**Keyword delimiters:** delimiters between keywords.

## 5.5 Subdomains

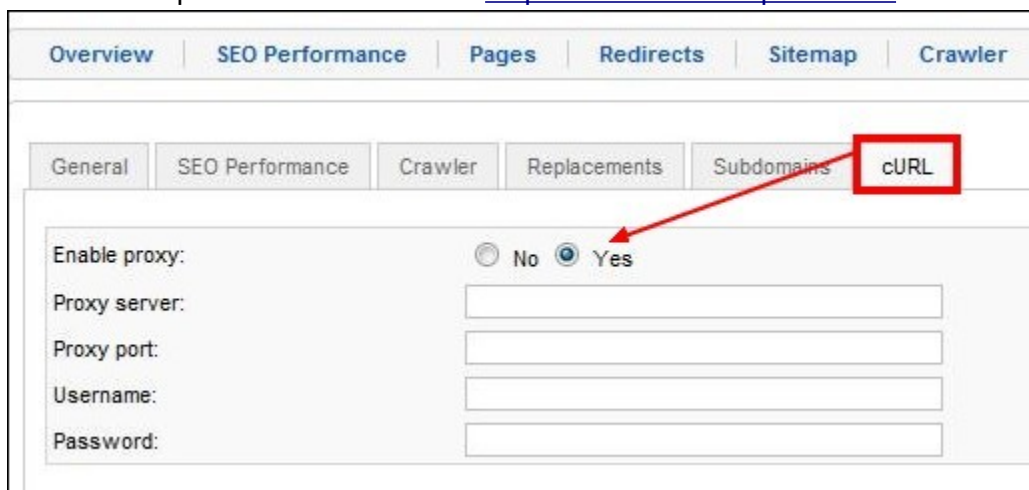

Here you can add any subdomains that you might have. This enables keyword tracking in the specified subdomains.

## 5.6 cURL settings

Here you can set up a usage with a Proxy server. This is particularly useful when your hosting provider does not allow **loopback** connections. Basically this will allow RSSEO! to perform page request via a third party server, thus bypassing the loopback limitation. - for more information about the loopback connections [see step 3.2 Minimum requirements](#).

- **Enable proxy:** yes/no
- **Proxy server:** the server address of the Proxy server
- **Proxy port:** the port that is used to make the connection
- **Username**
- **Password**

## 5.7 Keyword density settings

RSSEO! allows you to check the keyword density for each crawled page.

The screenshot shows the 'Keyword Density' settings panel. It has a tabbed interface with tabs for 'General', 'SEO Performance', 'Crawler', 'Replacements', 'Subdomains', 'cURL', and 'Keyword Density'. The 'Keyword Density' tab is selected and highlighted with a red border. Below the tabs, there are three settings:

- Enable keyword density:** A radio button for 'No' is unselected, and a radio button for 'Yes' is selected.
- Copy page keywords to page density keywords?:** A radio button for 'No' is selected, and a radio button for 'Yes' is unselected.
- Overwrite existing keywords?:** A checkbox is unselected.

- **Enable keyword density:** yes/no; enable or disable the keyword density.
- **Copy page keywords to page density keywords:** yes/no; by selecting this option you can copy the keywords that you have set in the "Meta Keywords" field of each page to the "Calculate keyword density" field.
- **Overwrite existing keywords:** yes/no; overwrite existing keywords in the "Calculate keyword density" field.

## Step 6: Crawl the Joomla! website

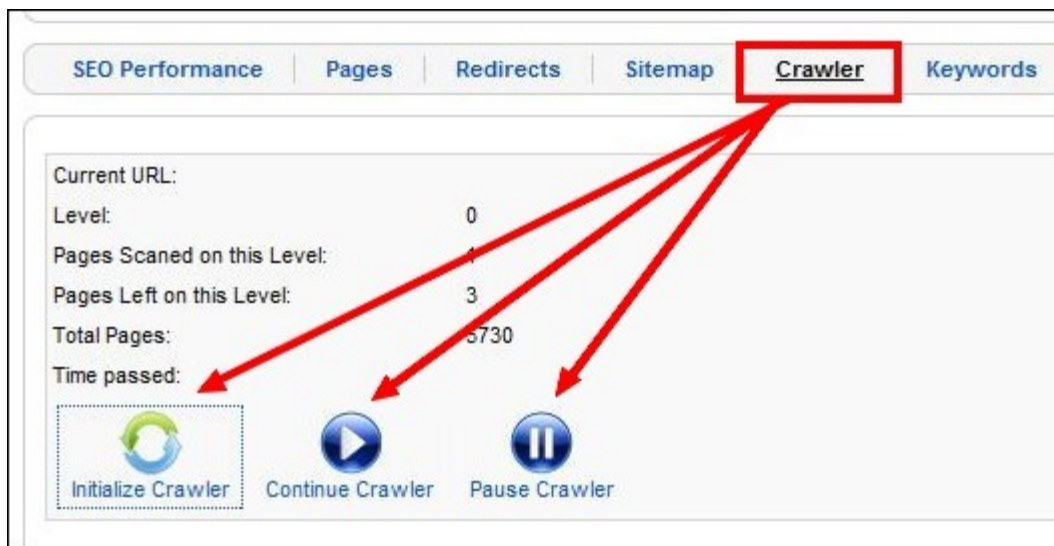

Path: *Joomla! backend panel >> Components >> RSSEO! >> Crawler*

It is recommended that this is the last step in completing your site, after eventual, SEF adjustments.

Before starting optimizing your Joomla! website for search engines, you need to crawl first the website pages to be able to analyze the on-page seo factors: meta tags, titles, meta descriptions, etc.

RSSEO! requires one of the following PHP functions to be able to crawl the site: **cURL** , **fsockopen** , **fopen** , **file\_get\_contents**. Make sure that you can use at least one of them in order for the crawler to work properly - see [step 3.2 Minimum requirements](#).

You can check these functions by going to **Components >> RSSEO!** and clicking the "Check Connectivity" button.

To start crawling the website, click on the **“Initialize Crawler”** button.

RSSeo! offers a progress status while crawling: the current page level (see [step 5.3 Crawler settings](#)) and URL, the number of pages scanned and the number of pages left crawling for the current level, the total number of crawled pages and the time passed since you’ve started crawling the pages.

You can use the “Continue” and the “Pause” buttons anytime during crawling.

#### **Notice:**

- RSSeo! Crawls the pages until it reaches the level configured in the Settings tab >> Crawler (see [step 5.3 Crawler Settings](#)). To crawl the entire website, you need to set the Crawl level to “Unlimited”

## **Step 7: Optimize your Joomla! website**

### **7.1 Optimize pages**

Path: **Joomla! backend panel >> Components >> RSSeo! >> Pages**

RSSeo! crawls the entire website, measures the on-page seo factors (titles, meta descriptions and keywords, headings, images, the sef URLs, page loading time and page speed) and gives a rating for each page in terms of seo effectiveness.

You can manually add pages for inspection or automatically add them via the RSSEO! Crawler (see [step 6: Crawl the Joomla! website](#)) when the auto-crawler option is enabled in the “**Settings**” tab - see [step 5.3 Crawler settings](#).

Page URL	Page Title	Page Level	SEO Grade	Last Crawled	Status	Page Modified
	Welcome to the Frontpage	0	60 %	10 Dec 10 14:47	✓	✗
on=com_content&d=25&Itemid=28&lang=en	What are the requirements to run Joomla! 1.5?	1	50 %	10 Dec 10 14:47	✓	✗
on=com_content&d=22&Itemid=29&lang=en	What's New in 1.5?	1	40 %	10 Dec 10 14:47	✓	✗

The general overview displays:

- **Page URL** - the URL of the added page
- **Page Title** - the title of the page
- **Page Level** - you can define a level for the added page. This applies only to those added manually.
- **SEO Grade** - estimated grade for each page. RSSEO takes into consideration the following configurable options (within the RSSEO! “**Settings**” tab - see [step Step 5: RSSEO! settings](#)) *URL is Search Engine Friendly, duplicate title tags, title tag length, duplicate meta description, meta description tag length, number of meta keywords, headings, images without the alt attribute, images without the height or width attribute*
- **Last Crawled** - date of the last refresh that was performed on the page or when the page was last crawled
- **Status** – Published/Unpublished
- **Page Modified** - Displays if the page has been modified or not
- **Add to sitemap** - Select whether the page will be added to the sitemap or not
- **Refresh** - You can click this option in order to refresh the page

## 7.1.1 Optimize titles

### 7.1.1.1 Title tag length

There are several SEO factors to focus when **optimizing title tags** for Joomla! websites:

1. unique titles

2. title tag length
3. keywords in title tags

*Examples of short and uninformative titles (usually one word title) that do not reflect the content of the page: "Home", "Frontpage", etc.*

**Notice:**

- Search engines value the user experience, so extremely lengthy titles and stuffed with keywords may not reflect the page content and may not be useful for them.
- A title tag must be informative and give a summary of the page content.
- A short title might be uninformative.
- A long title might be stuffed with unnecessary information for user and search engines may truncate it (generally if it exceeds 70 characters).

### 7.1.1.2 Duplicate title tags

Though Joomla! generates an insignificant number of pages, it is best to *avoid using the same title to entire website* or on large groups of pages. For example, the "Home Page" content is different than the "Contact us" content, so should be the title tags. All duplicate title tags are displayed in **RSSEO!** under the Pages tab, after crawling your Joomla! website.

**Notice:**

- *Unique title tags are a **must** for Joomla! websites.*
- The title tag is the most important on-page SEO factor, so focus on writing good title tags that will accurately reflect the content of a page. Search engines value the importance of the title tag;
- Choose carefully the targeted keyword; use research tools that suggest keywords like [Google Suggestion Tool](#) and [Trellian keyword discovery](#) that will return results based on area and search volume, ppc campaigns;
- When you decide what will be the targeted keyword for a page, include it in the title tag;
- [To increase the keyword prominence use it at the beginning of the title tag.](#)

		The Meta Title tag	
		<u>Checking for duplicate title tags</u>	This page title is unique. All the pages on your website should have unique page titles.
		<u>Checking for title tag length</u>	Your title tag length is OK! (24 characters). Try to limit the title page to 70 characters (if Google truncates the title to the first 64 characters).

## 7.1.2 Optimize meta keywords

The meta keywords has lost its value in time because of the abusive usage. Although some search engines still analyze the meta keywords tag, Google now completely ignores them.

		Checking the number of meta keywords	
		<u>Checking the number of meta keywords</u>	You have 2 keyword(s). Try to limit the meta keywords of each page around 10

### Tip:

- Avoid keyword stuffing in the meta keywords tag because it has a very minimal impact over the page ranking.

## 7.1.3 Optimize meta description

### 7.1.3.1 Meta description tag length

**Meta descriptions** are short snippets that search engines use in search results besides title tags to inform the user about the page content. A meta description tag must be informative and give a summary of the page content.

### Tips:

- A short meta description might be uninformative and may not convince the user to click on the page.
- Though it is not a rule, a long meta description might be stuffed with unnecessary information for user and the search engines may truncate it.

### 7.1.3.2 Duplicate meta description

By default, all Joomla! pages have the same meta tags: meta description and meta keywords. **RSSEO!** crawls the website and displays all duplicate meta tags and overrides the default ones: Joomla! - the dynamic portal engine and content management system and joomla, Joomla.

The **meta description** tag is important for search engines because it is used as snippets in the results page.

The Meta Description tag	
 <u>Checking for duplicate meta description</u>	This page meta description has already been used 1 time(s) <a href="#">Click here to see all pages</a>
 <u>Checking for the meta description tag length</u>	Your meta description is too short! (65 characters). Try to use more than 70 characters content.

#### Tips:

- Write an unique meta description for each Joomla! page
- avoid using too many keywords in meta description or keywords that aren't relevant for the page content; search engines value the user experience, so the meta descriptions stuffed with keywords may not reflect the page content and may not be useful for them.
- focus on writing good meta descriptions that will accurately reflect the page content because it could increase the users click-through rate;
- a well written meta description will lower the user click-back rate;
- choose carefully the targeted keyword and use it in meta description;
- avoid repeating the title tag in the meta description;
- avoid stuffing the meta description with too many keywords.

### 7.1.4 Optimize images

#### 7.1.4.1 Images without the height or width attribute

Set the “**width**” and the “**height**” attribute for images to **improve the user experience** and **website speed**.

When these attributes are not specified, the browser is forced to download the image and find its size before reading the entire content. Search engines are recommending to specify the width and the height attribute to optimize images.

### 7.1.4.2 Images with the “alt” attribute

The **HTML "Alt" attribute** is another on-page ranking factor with a moderate importance for search engines when evaluating the page relevance.

Using **descriptive names**, along with the **HTML "alt" attribute** will help search engines spiders to better understand what the image represents.

From the **user perspective**, the search engines are focusing on delivering relevant results in their index.

The search engines spiders are not performing very well when it comes to images: they can tell what a image is about, but they are not able to describe it accurately.

The "Alt" attribute is used:

- to describe an image when search engines crawlers can't interpret it
- to improve user experience: there are browsers that can't support images, so users will be able to read the description included in the "alt" attribute
- the alternative text will be interpreted by search engines as anchor text when the image is used as a link
- the "Alt" text and the file names may **increase website visibility in rankings** in the main index, as well as in the Google Images.

An image name that doesn't include the "alt" attribute, as the following example `` , won't provide much information for search engines about the image.

Using the "alt" attribute `` will give a better perspective to search engines.

*Google Guidelines* are recommending to take advantage of the “alt” attribute by accurately describing, in a few words, what the image is about. Using 7 to 10 descriptive words will help you with the on-page optimization and won't affect the website ranking (don't abuse it by stuffing the alternative text with too many keywords because the website risks to be penalized).

Checking for images			
		<u>Checking for images</u>	You have <b>17 images</b> on this page! Try to limit the number of images
		<u>Checking for images without the alt attribute</u>	There are <b>1 images</b> with no "alt" attribute. Google guidelines recom using too many words because Google might consider this a spam r
		<u>Checking for images without the height or width attribute</u>	There are <b>12 images</b> with no "width" or "height" attribute. Setting th experience.
		<u>Save images with descriptive names.</u>	You will get an extra chance to be listed in Google Images by saving instead).

#### Tips:

- use names that will describe the images: e.g *Joomla-logo.jpg* instead of *img10.jpg*
- avoid using long filenames
- save images in a directory used only for images: Joomla! has a special directory for images by default: */joomla/images/*
- set the width and height attributes to be *W3C compliant*, although is a minor **on-page SEO factor** you will earn extra points in front of your competitors.
- for thumbnail images use their actual size to optimize them for optimal download times (and reduce bandwidth).
- make use of the “alt” attribute to accurately describe images
- specify the width and the height attribute to optimize images.

### 7.1.5 Keywords density tool

Besides analyzing on-page seo-factors, RSSeo! allows you to check the keyword density.

The keyword density shows the percentage of times a keyword appears on a page compared to the total number of the words on that page.

With the keyword density tool you can maintain the right keyword balance, between 2 and 8%, on each Joomla! page.

A higher density rate (over 8%) shows an excessive use of the targeted keywords, a lower density rate might indicate that your page needs further optimization for the targeted keyword.

#### Tips:

- focus on writing content for your readers, not for search engines; a good written page, with a lower keyword density might be more relevant than a page stuffed with keywords.
- avoid using the [targeted keywords excessively](#), you might risk search engines penalties.
- use synonyms to avoid stuffing the page with keywords; a good start is by using the Google Wonder Wheel tool (shows related search terms to the current searched query ) and the [Google Keyword Suggestion tool](#).

## 7.1.6 Optimize page speed and page loading time

The **Page loading time** is a rather new parameter introduced by search engines. Basically, the user experience on the site is taken into consideration. The faster the page loads, the better.

The **Page Size** is a direct factor in the Page loading time that should be taken into consideration. Instead of having a rather large page loaded from the start it is recommended to break it into smaller pieces.

Check for page loading time and page size	
Page loading time	This page loads in <b>0.004 seconds</b> . Search engines recommend to red
Page size	This page has <b>0.52 KB</b> . When this value is minimum, the page loading ti

URL : <a href="http://[redacted]/blog-view.html">http://[redacted]/blog-view.html</a>		Size : 0.52 KB	
#	Elements of Webpage	Filesize	Frequency
1	<a href="http://webinar.rsjoomla.com/joomla/blog-view.html">http://webinar.rsjoomla.com/joomla/blog-view.html</a>	0.52 KB	1
Total webpage size		0.52 KB	

### Tip:

- keep page requests low (AJAX scripts), load thumbnail images instead of the whole large image scaled down via HTML tags and scripts that are downloaded to a minimum.

## 7.1.7 Optimize headings:

Joomla! uses 2 classes for headings: "*contentheading*" and "*componentheading*" instead of the html tags <h1>, ..., <h6>, therefore search engines spiders won't recognize these classes as headings. **RSseo!** replaces them with the headings: <h1>, <h2>, <h3>, <h4>, <h5> or <h6> if the replacement options from the "Settings" tab are enabled - see [step 5.4 Replacement options](#).

Checking for headings			
		<u>Checking for headings</u>	You have <b>15 headings</b> on this page. Headings are important underneath them.

### Tips:

- Imagine a webpage as a whitepaper and use appropriately headings and subheadings to emphasis the subject of a page.
- Don't dilute the content of the page and focus on the topic described on the primary heading.
- when optimizing a Joomla! website make sure that RSSEO! is configured to replace the "contentheading" and "componentheading" class from Joomla! with <h1>, ..., <h6> - see [step 5.4 Replacement options](#)
- Include the targeted keyword on headings; try to use it at the beginning of the tag

## 7.1.8 Optimize internal links

Path: **Joomla! backend panel >> Components >> RSSEO! >> Keywords >> Add Internal Anchor link to.**

### 7.1.8.1 Search engine friendly URLs

Search Engines prefer pages without dynamic parameters. When crawling a website, the page URL is the first thing that search engines spiders are reading. A complex link with parameters (dynamic URL) as *Joomla! default links are, is hard to read by crawlers.*

A **dynamic URL** is the result of specific queries made to the website database. For example:  
[http://localhost/joomla/index.php?option=com\\_content&view=section&id=3&Itemid=41](http://localhost/joomla/index.php?option=com_content&view=section&id=3&Itemid=41)

A **SEF URL** does not contain query parameters as "?", "&" or "=" :  
<http://localhost/joomla/index.php/faq>

The URL			
		<u>Checking if the URL is Search Engine Friendly</u>	The page URL is search engine friendly

### Tips:

- Enable search engine friendly URLs in Joomla! by activating the SEF option from the Joomla! administrator panel. *Just head to **Site -> Global Configuration -> SEO Settings** and set "**Search Engine Friendly URLs**" option to Yes.*
- A SEF URL will have a better click-through rate than a dynamic URL in the SERP (search engine results page)

#### 7.1.8.2 Add anchor text to links

Internal links may be optimized by adding anchor text.

Search engines are using the anchor text to determine the subject of the linked page, therefore the internal anchor links are considered an important on-page seo factor.

To add internal anchor links with RSSeol!, head to the "Keywords" tab, add a new keyword and enter the location where you would like to point the keyword.

Keyword Name:	computer parts
Keyword Importance:	Critical
Make Keyword Bold:	<input checked="" type="radio"/> No <input type="radio"/> Using <strong> <input type="radio"/> Using <b>
Underline keyword:	<input checked="" type="radio"/> No <input type="radio"/> Yes
Keyword attributes:	
Add Internal Anchor Link to:	<a href="http://www.mywebsite.com/internal-link">http://www.mywebsite.com/internal-link</a>

### Tips:

- Add the targeted keywords in the anchor text
- Avoid using an excessive internal anchor text linking and keyword stuffing techniques: you might risk a Google penalty

#### 7.1.8.3 Check for internal/external links

Internal and external links are an important part of the site architecture.

Google's webmaster guidelines recommends to limit the number of internal and external links on each page to 100.

There are 3 reasons why you should resume to 100 links:

- **Crawling issues:** an increased number of links on a page may cause some difficulties when it comes to crawling a website. This could result in a lower number of indexed

pages present in search engines index page. Google may choose not to index all these links.

- **User experience:** although a page with a multitude of internal and external links might not be considered spammy by search engines (as long as it does not include hidden links and other blackhat seo practices), users might be overwhelmed by these links.
- **Dividing the Page Rank** to more than 100 links.

Checking for internal/external links	
 	<u>Checking for internal/external links</u> You have fewer than 100 internal and external links on this page. Google's design of links per page to 100.

#### Tip:

- Google's webmaster guidelines recommends to limit the number of internal and external links on each page to 100.

## 7.2 Keywords

### 7.2.1 Optimize keywords

Path: **Joomla! backend panel >> Components >> RSSEO! >> Keywords**

There are several methods used to optimize keywords for search engines:

- make **bold keywords:**
- make **underline keywords:**
- add **internal anchor links:**

The “**Keyword replacement**” option from the “Keywords” tab allows you to set a replacement limit per page when applying the selected options to keywords.

**e.g. if you've selected the “Make Keyword Bold” option and the Keyword replacement “2 times”, than RSSEO! makes 2 keywords bold on each page.**

Overview | SEO Performance | Pages | Redirects | Sitemap | Crawler | **Keywords**

Keyword Name: computers

Keyword Importance: Important ▼

Make Keyword Bold:  No  Using <strong>  Using <b>

Underline keyword:  No  Yes

Keyword replacement: 2 times

Keyword attributes: target="blank"

Add Internal Anchor Link to: http://www.mywebsite.com/computers

**Keyword importance:** when adding new keywords, you can set their relevance by choosing the importance level for your website: low, relevant, important and critical to better. Its' useful especially when you monitor a lot of keywords and you want to sort them by their importance.

e.g.

- if you consider that the keyword **“computers”** is relevant for your website, you can set its level to **“Important”**
- if you consider that the keyword **“computer parts”** is vital for your website, you can set its level to **“critical”**

Overview | SEO Performance | Pages | Redire

Keyword Name: computers

**Keyword Importance:** Important ▼

Make Keyword Bold:  No  Using <strong>  Using <b>

Underline keyword:  No  Yes

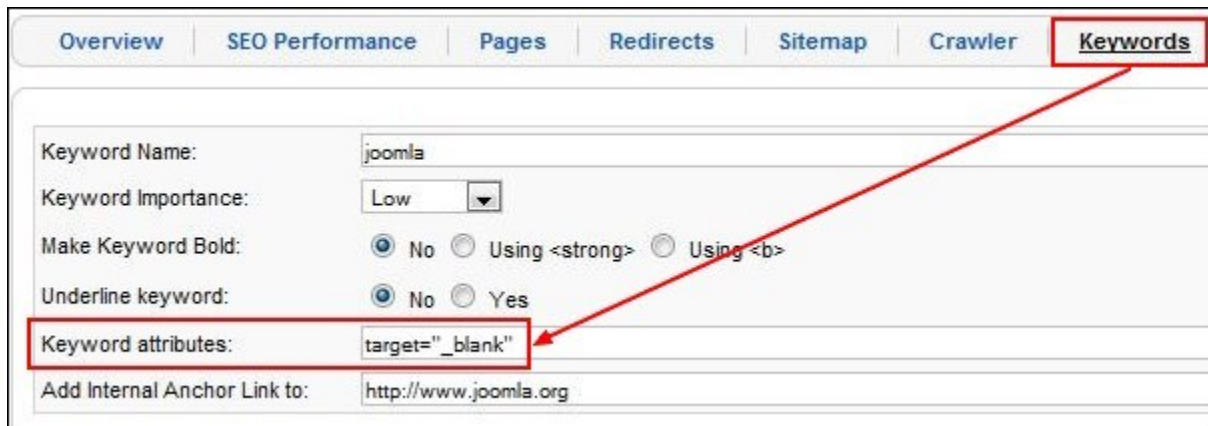

Keyword attributes: target="blank"

**Keyword attributes:** the keyword attributes box allows you to add *target attributes, javacript codes/triggers, styles and classes.*

## 1. The target attribute:

You can add target attributes to your keywords to specify where to open the linked document.

e.g. `target="_blank"`  
`target="_self"`  
`target="_parent"`  
`target="_top"`

The screenshot shows the Joomla! administration interface for configuring keywords. The 'Keywords' tab is selected and highlighted with a red box. A red arrow points from this tab to the 'Keyword attributes' field, which contains the text `target="_blank"`. Other fields include 'Keyword Name' (joomla), 'Keyword Importance' (Low), 'Make Keyword Bold' (No), 'Underline keyword' (No), and 'Add Internal Anchor Link to' (http://www.joomla.org).

## 2. The Javascript attribute

You can add Javascript code to your keywords.

e.g. `onclick="changeCSS('.exampleA','color','red')"`

The screenshot shows the Joomla! administration interface for configuring keywords. The 'Keywords' tab is selected and highlighted with a red box. A red arrow points from this tab to the 'Keyword attributes' field, which contains the text `onclick="changeCSS('.exampleA','color','red')"`. Other fields include 'Keyword Name' (joomla), 'Keyword Importance' (Low), 'Make Keyword Bold' (No), 'Underline keyword' (No), and 'Add Internal Anchor Link to' (http://www.joomla.org).

## 3. The style attribute

You can use the "Style" attribute to style the keywords.

e.g. `style="font-family:verdana"`  
`style="color:red"`

#### 4. The class attribute

You can specify a classname for a keyword using the “class” attribute.

e.g. `class="internal-anchor-link"`

### 7.2.2 Monitor keyword position

Path: **Joomla! backend panel >> Components >> RSSEO! >> Keywords**

RSSEO! allows you to add in the “Keywords” tab one or multiple keywords at once to monitor and record the keyword position in Google, each time you refresh the data.

The keyword evolution is highlighted using 2 colors: the green color indicates an improvement in the SERP (search engine results page) and the red color shows that the keyword has dropped a few positions.

Keyword	Keyword Importance	Keyword Position	Date Refreshed	Refresh
<a href="#">computer parts</a>	critical	8	21 Apr 10 04:31	Refresh
<a href="#">computers</a>	important	24	20 Nov 09 07:02	Refresh
<a href="#">computer games</a>	low	8	21 Apr 10 04:31	Refresh

**Notice:**

- The keyword position may vary based on several factors: universal or local search (a certain keyword may be in the 5-th position in the [google.com](http://google.com) index and in the first [google.nl](http://google.nl) position), personalized search and search engines restrictions.

### 7.3 Add redirects (optional)

Path: **Joomla! backend panel >> Components >> RSSEO! >> Redirects**

RSSEO! allows you to setup in the “Redirects” tab permanent (301) or temporary redirects (302) when they are required.

#### Step 1:

In the “Redirects” tab, click on the “New” icon from the right.

#### Step 2:

Enter the redirect links.

## Step 8: Submit a sitemap to search engines

Path: **Joomla! backend panel >> Components >> RSSEO! >> Sitemap**

After crawling and optimizing website pages, you can submit a sitemap to Google, Bing and Yahoo!

### 8.1 Why use a XML sitemap?

Sitemaps are important for search engines for several reasons:

- you can inform search engines about URLs that may not be discoverable by crawlers in the absence of a sitemap.
- you can help search engines to better understand the site structure (usefully for large sites or sites with dynamic content as Joomla! is )
- you will be provided with valuable information when submitting the sitemap in Google, Yahoo or Bing webmasters accounts : possible crawling errors, the number of indexed URLs, meta tag issues, duplicate content, etc
- the crawlers can discover new content faster, so the number of indexed pages and the number of pages present in SERP may increase.

### 8.2 Enable canonicalization

Path: **Joomla! backend panel >> Extensions >> Plugin Manager >> System RSSEO**

Before submitting the sitemap to search engines, you need first to enable the canonicalization.

The canonicalization allows you to indicate search engines the preferred URL version: with or without “www”.

Choosing the preferred domain helps Google understand what you prefer to be indexed and how the links will be displayed in its index: with "www" in front of the domain or without.

#### Step 1:

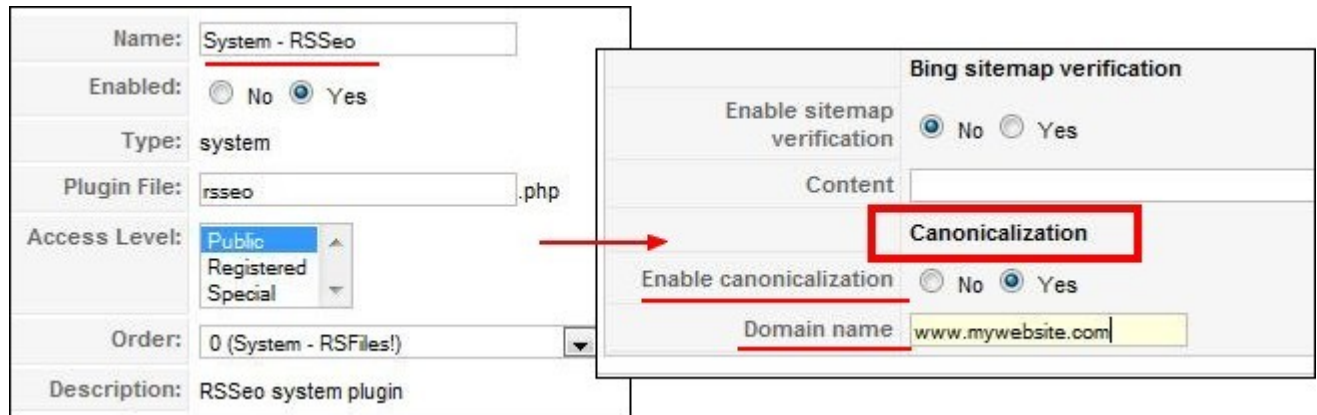

To enable the canonicalization, head to the Plugin Manager and look for the System RSSEO! plugin. ( the System RSSEO! plugin installs same time with the component - make sure it's enabled).

#### Step 2:

In the “Plugin Parameters” section, set to “Yes” the enable canonicalization option and add the preferred domain version, with or without www.

e.g. - **with “www”**: [www.mywebsite.com](http://www.mywebsite.com): it will setup a permanent redirect from [mywebsite.com](http://mywebsite.com) to [www.mywebsite.com](http://www.mywebsite.com)

- **without “www”**: [mywebsite.com](http://mywebsite.com): it will setup a permanent redirect from [www.mywebsite.com](http://www.mywebsite.com) to [mywebsite.com](http://mywebsite.com)

## 8.3 Generate sitemaps with RSSEO!

### 8.3.1 Generate XML sitemaps

Path: **Joomla! Backend panel >> Components >> RSSEO! >> Sitemap >> XML Sitemap**

#### Step 1:

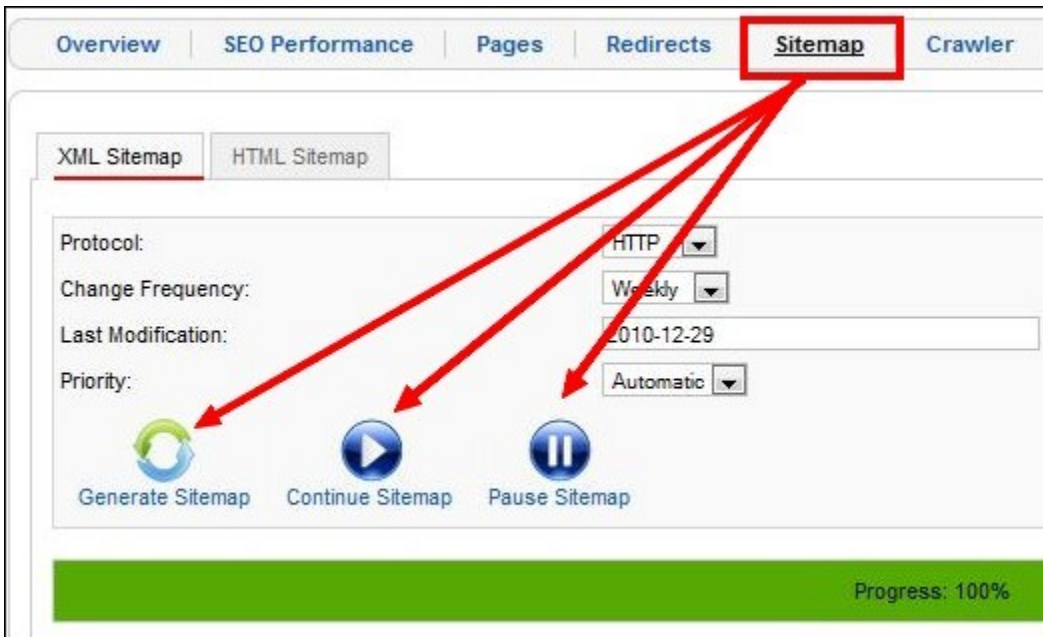

Create 2 xml files: **ror.xml** and **sitemap.xml** and place them in the root before generating the sitemap.

#### Step 2:

Head to the “Sitemap” tab and click on the “Generate Sitemap” button.

By default, the RSSEO! Sitemap has the following settings:

**Protocol:** HTTP (you can choose to generate a sitemap with “http” or “https”)

**Change Frequency:** weekly; (if your website pages update weekly you should use weekly, if your website pages update daily than you should use “daily”).

**Priority:** automatic

RSSEO! calculates the appropriate priority for each page and assigns a value between 0 and 1 (0.0, 0.1, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9, 1.0 , meaning 1.0 is the highest priority level and 0.0 is the lowest).

Your home page might be extremely important (1.0), while a product category page is very important (.8), and a product detail page less so (0.6). You might choose to set the importance of other pages, such as Privacy Policy, Terms and Conditions, Contact Page lower still. It's likely that the search engines will crawl more often pages with a higher priority level.

**Last modification:** RSSEO! automatically includes the last modified date of the sitemap.

**Tip:**

- Use robots.txt to exclude content that you don't wish to be indexed by search engines.
- The priority level doesn't influence the website rankings

### 8.3.2 Generate HTML sitemaps

Path: **Joomla! backend panel >> Components >> RSSeol >> Sitemap >> HTML Sitemap**

The HTML sitemaps is a collection of links that improve user experience while browsing your website.

To generate the HTML sitemap, just select the menu items that you wish to include/exclude from the sitemap and press the “Generate” button.

#### Publish the HTML sitemap

To publish the HTML sitemap in frontend, you need to create a RSSeol Menu item in the “**Menu Manager**” area.

##### Step 1:

Head to the **Menus >> Menu Manager**, select the “Main Menu” and click on the “Menu Item” icon

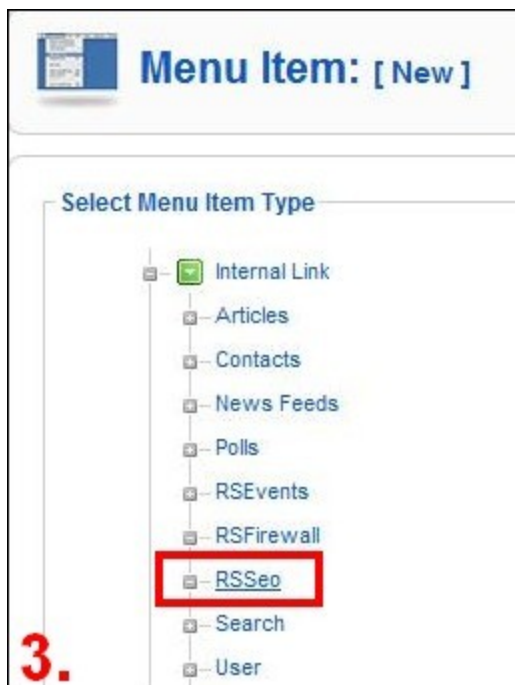

##### Step 2:

In the “**Menu Item Manager**”, click on the “New” button from the right panel.

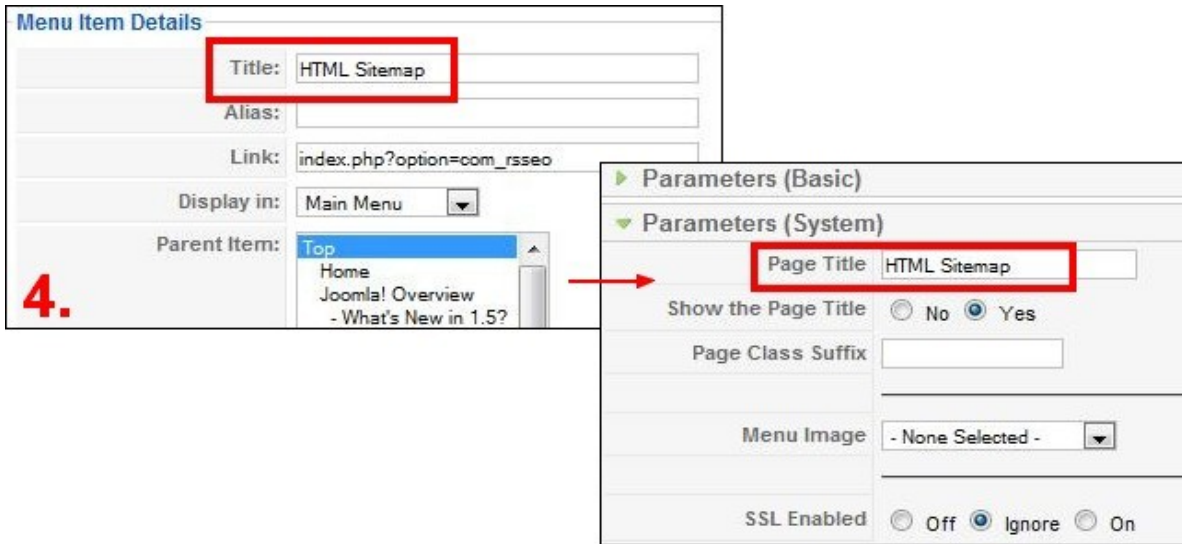

**Step 3:**

Select the RSSe! Menu Item.

**Step 4:**

Add the menu item and the page title and click the "Save" button.

In frontend, you can also access the HTML sitemap by typing the direct link:  
[http://www.\\*\\*\\*.com/index.php?option=com\\_rsseo](http://www.***.com/index.php?option=com_rsseo).

## 8.4 Submit the sitemaps to search engines

### 8.4.1 Submit the sitemap to Google

Before submitting the sitemap to Google Webmaster Tools, you need to verify site ownership. This can be easily done with the RSSEO! System Plugin (it installs same time as the component).

#### 8.4.1.1 Verify the siteownership for Google Webmaster Tools

##### Step 1:

Access your Google Webmaster Tools account and add your site address.

##### Step 2:

Choose the second verification method: using the meta tag.

## Verify ownership

Verification status **Not Verified**

There are several ways to prove to Google that you own <http://www.mywebsite.com/>.

Add a DNS record to your domain's configuration  
You can use this option if you can sign in to your domain registrar or hosting provider.

Add a meta tag to your site's home page  
You can choose this option if you can edit your site's HTML.

**2.** Upload an HTML file to your server  
You can choose this option if you can upload new files to your site.

### Step 3:

Copy the meta tag content generated in your Google Webmaster Tools account.

#### Instructions:

1. Copy the meta tag below, and paste it into your site's home page. It should go in the `<head>` section, before the first `<body>` section.

**3.**

```
<meta name="google-site-verification" content="YAJQ4-KA7GXO6wEH-ARYmk4DWhdXwQNFwIwgbwd0MIGQ" />
```

### Step 4:

In the Joomla! backend panel, head to the **"Plugin Manager"** >> **System RSSeo!**, enable the Google sitemap verification and paste the meta tag content in the **"Content"** box. Make sure that the **google-site-verification** method is checked.

#### Parameters

##### Plugin Parameters

**Google sitemap verification**

Enable sitemap verification  No  Yes

Verification name  google-site-verification  verify-v1

**4.**

Content YAJQ4-KA7GXO6wEH-ARYmk4DWhdXwQNFwIwgbwd0MIGQ

### 8.4.1.2 Submit the sitemap

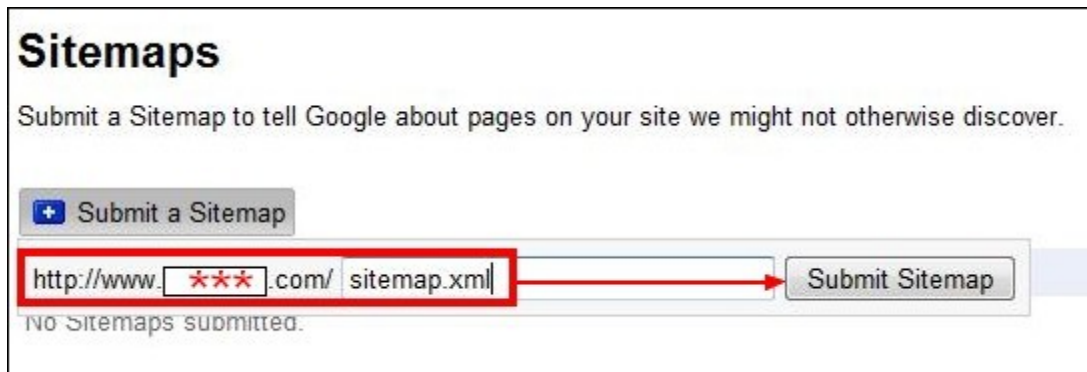

The sitemaps are located at the following addresses:

<http://www.mywebsite.com/sitemap.xml>

<http://www.mywebsite.com/ror.xml>

To submit the sitemap to Google, head to the **Google Webmaster Tools >> Site Configuration >> Sitemaps >> click on the “Submit a Sitemap” button.**

After the website address, type sitemap.xml as shown in the below screenshot and hit the “Submit Sitemap” button.

**Sitemaps**

Submit a Sitemap to tell Google about pages on your site we might not otherwise discover.

No Sitemaps submitted.

### 8.4.2 Submit the sitemap to Yahoo!

Before submitting the sitemap to Yahoo!, you need to verify site ownership.

This can be easily done with the RSSeo! System Plugin (it installs same time as the component).

#### 8.4.2.1 Verify the siteownership for Yahoo!

##### Step 1:

Access your **Yahoo! Site Explorer** account at the following address:

<https://siteexplorer.search.yahoo.com> and submit your website to Yahoo!

Site Explorer

- My Sites
- Submit Your Site**
- Preferences
- Blog
- Badge
- Web Service API
- Feedback

Enter the URL for the website or webpage you would like to submit. For any URL (directly submitted or obtained from a feed) our crawler will extract links and find pages we have not discovered already. We will automatically detect updates on pages and remove dead links on an ongoing basis.

**1.**

### Step 2:

Copy the meta tag content generated in your Yahoo! account.

By adding a META tag to my home page.

Copy the META tag listed below and paste it in your site's home page:

`<META name="y_key" content="df15e44f20b0fe2d" />`

The META tag must be within and near the beginning of the first <HEAD> section of the page, and before the first <BODY> section.

**2.**

### Step 3:

In the Joomla! backend panel, head to the **"Plugin Manager" >> System RSseo!**, enable the Yahoo! sitemap verification and paste the meta tag content in the **"Content"** box.

Name:	System - Rsseo
Enabled:	<input type="radio"/> No <input checked="" type="radio"/> Yes
Type:	system
Plugin File:	rsseo.php
Access Level:	Public
Order:	-100 (System - Rsseo)
Description:	RSseo system plugin

Content:	<b>Yahoo! sitemap verification</b>
Enable sitemap verification:	<input type="radio"/> No <input checked="" type="radio"/> Yes
Content:	<code>df15e44f20b0fe2d</code>
Bing sitemap verification:	<input checked="" type="radio"/> No <input type="radio"/> Yes

**3.**

### 8.4.2.2 Submit the sitemap

The sitemaps are located at the following addresses:

[http://www.\\*\\*\\*.com/sitemap.xml](http://www.***.com/sitemap.xml)

[http://www.\\*\\*\\*.com/ror.xml](http://www.***.com/ror.xml)

To submit the sitemap to Yahoo!:

- access your Site Explorer account <https://siteexplorer.search.yahoo.com>
- select the website for which you want to add the sitemap
- click on the “Feeds” link from the left menu
- you can submit feeds to Yahoo! in a sitemap.xml and ror.xml format. In the “Feeds” box, add the sitemap addresses as shown in the below screenshot.

### 8.4.3 Submit the sitemap to Bing

#### 8.4.3.1 Verify the siteownership for Bing

##### Step 1:

Access your **Bing Webmaster Tools** account at the following address

<http://www.bing.com/toolbox/webmasters/> and submit your website to Bing

You have not added any sites. Begin by adding a site.

**Add Site**

Enter the URL of a site to use the Bing Webmaster Tools.

Site:

www.mywebsite.com

Submit Cancel

**1.**

### Step 2:

Copy the meta tag content generated in your Bing Webmaster Tools account.

Choose one of the following:

► [Option 1: Place an XML file on your web server](#)

Or

▼ **[Option 2: Copy and paste a <meta> tag in your default webpage](#)**

You can add a <meta> tag containing the authentication code to the <head> section of your default webpage.

**2.** <meta name="msvalidate.01" content="4CD5D81992E1FD627CCDB88209DB6623" />

### Step 3:

In the Joomla! backend panel, head to the **"Plugin Manager" >> System RSSeol**, enable the Bing sitemap verification and paste the meta tag content in the **"Content"** box.

**Bing sitemap verification**

Enable sitemap verification  No  Yes

**Content** 4CD5D81992E1FD627CCDB88209DB6623

Canonicalization

Enable canonicalization  No  Yes

**3.**

### 8.4.3.2 Submit the sitemap

To submit an XML-based Sitemap to Bing:

**Step 1:** Copy and paste the entire URL below as a single URL into the address bar of your browser:

***http://www.bing.com/webmaster/ping.aspx?sitemap=www.\*\*\*.com/sitemap.xml***

**Step 2:** Change “www.\*\*\*.com” to your domain name

**Step 3:** Press ENTER

## Step 9 : Monitor and compare the SEO performances

Path: ***Joomla! backend panel >> Components >> RSSeo! >> Seo Performance***

RSSeo! allows you to monitor your website seo performances (***Page Rank, Alexa Rank, Technorati Rank, Google, Yahoo! & Bing pages, Google, Yahoo! & Bing backlinks and the [dmoz.org listing](#)***) and compare them against your competitors using the “Compete” integration. The extension records these performances in the “History” area, so you can easily analyze how you and your competitors evolve in time.

***Page Rank:*** the Google algorithm that determines a site popularity based on the number of pages that link back to it. The Google Page Rank is one of the 200 ranking factors that determines a site position in SERP (search engine results page). In general, webmasters can improve the rank of their sites by increasing the number of high-quality sites that link to their pages.

***Alexa Rank:*** the Alexa Rank is a complex algorithm that uses several analytics factors (page views and users) to estimate website traffic based on the amount of users that visited a website with the Alexa toolbar installed.

#### **Tip:**

- The lower your *Alexa Rank* is the more popular your site is.

***Technorati Rank:*** is a site's rank among the Technorati Authority of all sites. 1 is the highest rank.

**Indexed pages:**

- ***Google Pages:*** the number of your site indexed pages as shown by Google

- **Yahoo! Pages:** the number of your site indexed pages as shown by Yahoo!
- **Bing Pages:** the number of your site indexed pages as shown by Bing

### Backlinks:

- **Google Backlinks:** the number of websites that link back to your site as shown by Google
- **Yahoo! Backlinks:** the number of websites that link back to your site as shown by Yahoo!
- **Bing Backlinks:** the number of websites that link back to your site as shown by Bing

[dmoz.org](http://dmoz.org) directory: although is not considered a direct seo ranking factor, quality directories (human edited directory) listings are considered powerful.

## 9.1 Add new competitors

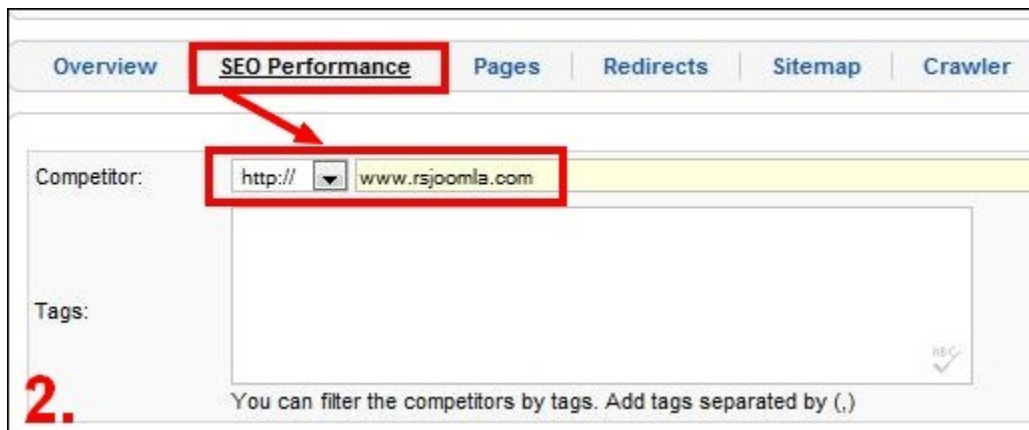

### Step 1:

Click on the “New” icon from the “Seo Performances” tab to add your website or new competitors.

### Step 2:

Add the website URL and save the record.

### Step 3:

Click on the “Refresh” link to process all the configured seo performances: the Page Rank, Alexa Rank, Technorati Rank, Google, Yahoo! & Bing pages, Google, Yahoo! & Bing backlinks.

Page Rank	Alexa Rank	Tehnorati Rank	Google Pages	Refresh
3. Not Processed	Not Processed	Not Processed	Not Processed	<a href="#">Refresh</a>

### History:

The “History” tab allows you to track in a simple way, your competitors evolution in time. RSSeO! records in the “History” tab your competitors seo performances each time you refresh the data.

ID	<input type="checkbox"/>	History	Competitor	Page Rank	Alexa Rank
10	<input checked="" type="checkbox"/>		<a href="http://www.google.com">http://www.google.com</a>	10	1
9	<input checked="" type="checkbox"/>		<a href="http://www.yahoo.com">http://www.yahoo.com</a>	9	4

The websites evolution will be highlighted in the “History” tab using 2 colors: the green color indicates an improvement and the red color a decline of their online presence.

#### Notice:

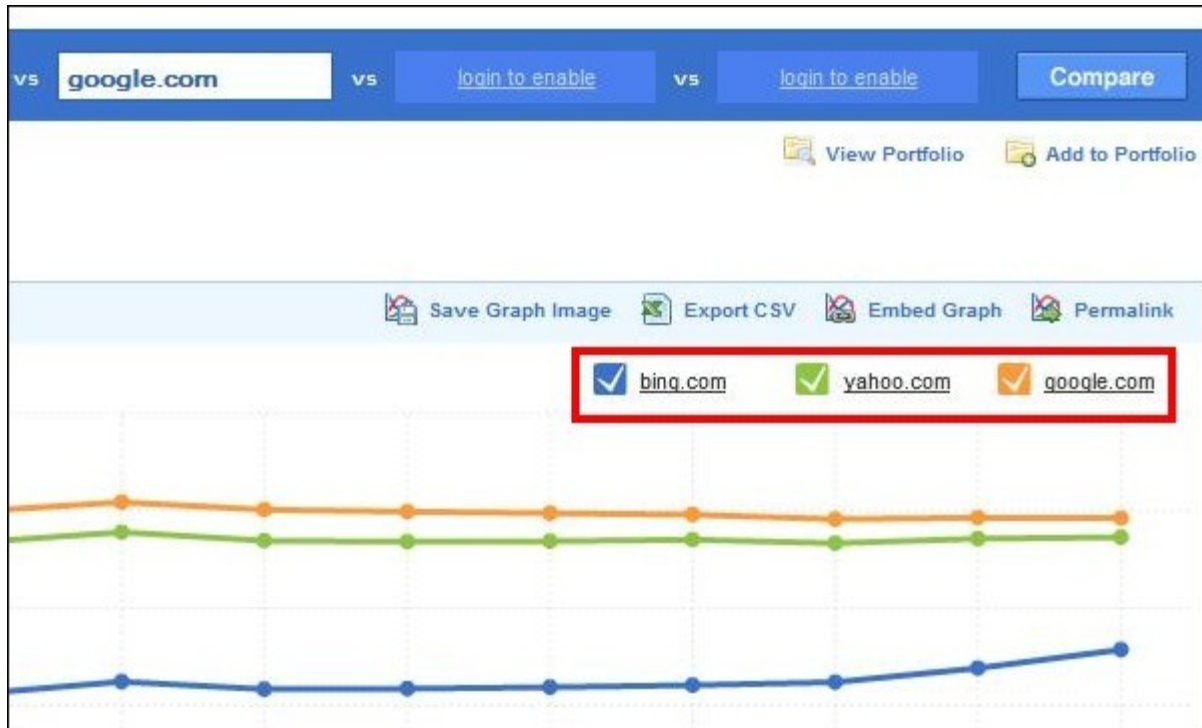

- A decreased Alexa Rank shows an improvement of your site SEO performances; the lower your *Alexa Rank* is the more popular your site is.
- Google, Yahoo and Bing will display a different number of backlinks for a website because of their specific restrictions, privacy policy as well as other factors.

SEO Performance		Pages	Redirects	Sitemap	Crawler	Keywords	Settings	Updates
ID	<input type="checkbox"/>	Page Rank	Alexa Rank	Google Pages	Yahoo Pages	Bing Pages	Google Backlinks	Yahoo Backlinks
2	<input type="checkbox"/>	6	26.850	1.700	11.307	7.500	127	10.394
1	<input type="checkbox"/>	6	27.060	1.670	11.328	6.410	127	10.462

### Compete:

After adding competitors in the “SEO Performances” tab, you can compare their online performance using the Compete tool.

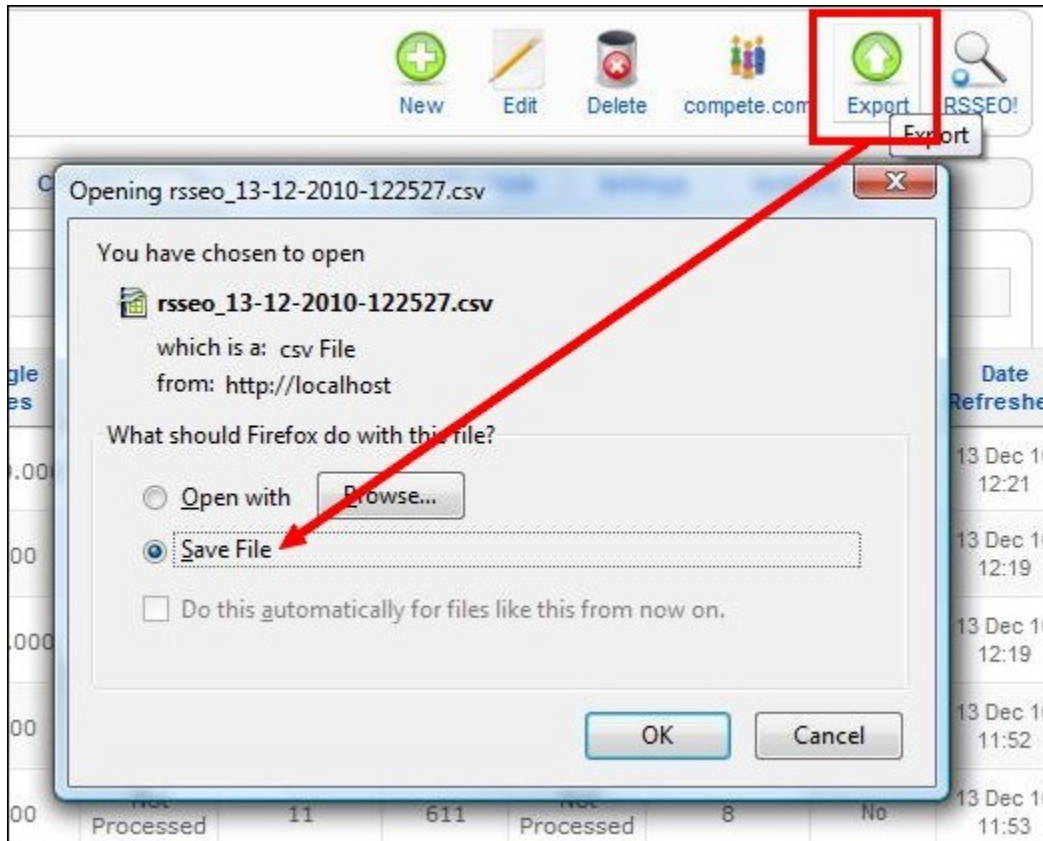

Their algorithm estimates traffic and offers several analytics data about your competitors site: unique visitors, visits, page views, referral sites, etc.

### Export:

RSSEO! allows you to export the list with the competitors SEO performances in a .csv file, by clicking the “Export” button from the right side.

## Step 10: Google Analytics Integration

RSSEO! offers two important integrations: Google Analytics tracking and reports, both configurable via the **“Configuration” tab >> Google Analytics Integration.**

General	SEO Performance	Google Analytics Integration	Crawler	Replacements
Enable Google Analytics reports?: <input type="radio"/> No <input checked="" type="radio"/> Yes				
Analytics login:		<input type="text" value="email@gmail.com"/>		
Analytics password:		<input type="password" value="....."/>		
Enable Google tracking: <input type="radio"/> No <input checked="" type="radio"/> Yes				
Web property ID:		<input type="text" value="UA-xxxxxxx-x"/>		

- **Enable Google Analytics reports?:** No / Yes
- **Analytics login:** gmail account email address
- **Analytics password**
- **Enable Google tracking:** No / Yes - if enabled, RSseo! will automatically include the Google Analytics tracking code into your site source.
- **Web property ID:** Google unique identification number for tracking purpose - [read more](#).

## Google Analytics Reports

Rsseo! displays via the “Analytics Manager” tab, the three most important Google Analytics reports: **“Visitors”, “Traffic Sources”, “Content”**.

### 10.1.1 Visitors

This report allows you to analyze the user behaviour by measuring specific visitors metrics: visits, unique visitors, pageviews, average pageviews, average time on site, bounce rate, new vs returning visitors, browser capabilities and mobile devices.

As general statistics, RSSEO! displays the following information:

- **Visits:** Visits represent the number of individual sessions initiated by all the visitors to your site. If a user is inactive on your site for 30 minutes or more, any future activity will be attributed to a new session. Users that leave your site and return within 30 minutes will be counted as part of the original session.
- **Unique visitors:** Unique Visitors represents the number of unduplicated (counted only once) visitors to your website over the course of a specified time period. A Unique Visitor is determined using cookies.
- **Pageviews:** A pageview is defined as a view of a page on your site that is being tracked by the Analytics tracking code. If a visitor hits reload after reaching the page, this will be counted as an additional pageview. If a user navigates to a different page and then returns to the original page, a second pageview will be recorded as well.
- **Average pageviews:** This represents the average number of pages viewed during a visit to your site. Repeated views of a single page are counted.
- **Average time on site:** The average duration visitor sessions represented in total seconds.
- **Bounce rate:** Bounce rate is the percentage of single-page visits (i.e. visits in which the person left your site from the entrance page). Bounce rate is a measure of visit quality and a high bounce rate generally indicates that site entrance (landing) pages aren't relevant to your visitors. You can minimize Bounce Rates by tailoring landing pages to each keyword and ad that you run. Landing pages should provide the information and services that were promised in the ad copy.
- **New visits:** Google Analytics records a visitor as **new** when any page on your site has been accessed for the first time by a web browser. This is accomplished by setting a first-party cookie on that browser. Thus, new visitors are not identified by the personal information they provide on your site, but are rather uniquely identified by the web browser they used.

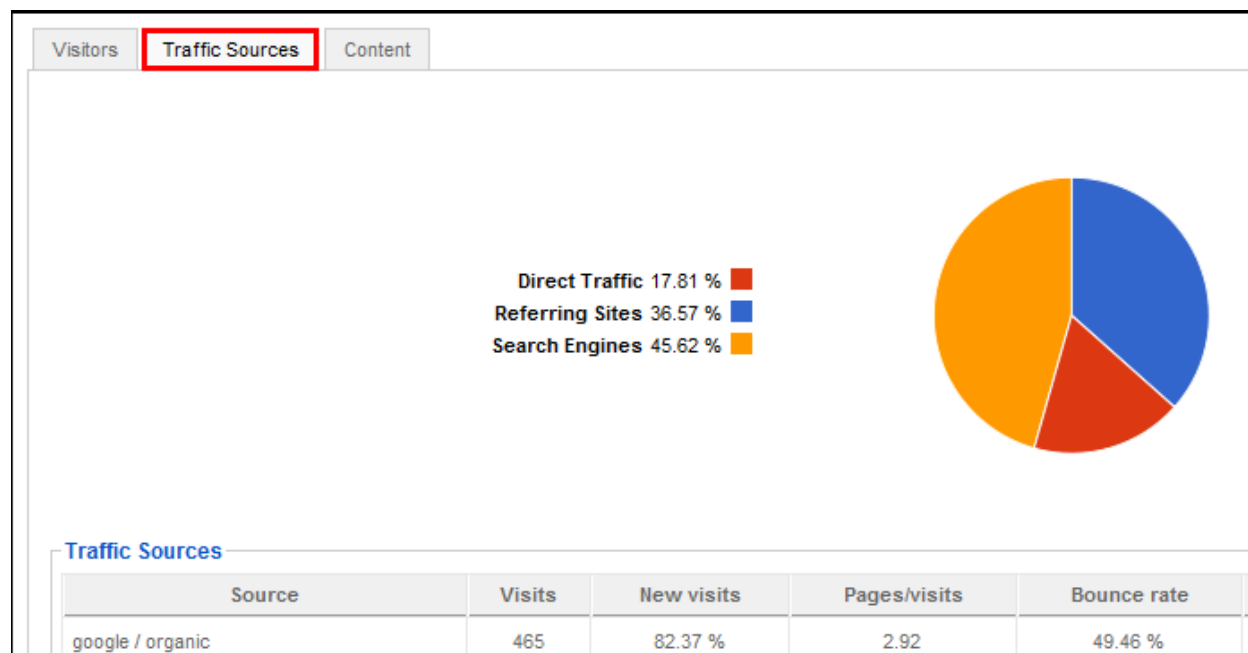

Besides the general statistics a *New VS Returning* table is also displayed:

New VS Returning				
Visitors type	Visits	Pages/visits	Bounce rate	Average time on site
Returning Visitor	364	2.20	64.29 %	00:02:02
New Visitor	884	2.98	46.49 %	00:03:09

## 10.1.2 Traffic sources

This is one of the most popular Google Analytics reports, offering helpful insights of the website sources/mediums that send traffic: organic, direct or referral.

Besides listing the top 20 site referrals based on representative traffic metrics (visits, new visits, pages per visit, bounce rate and average time on site), RSSEO! generates a pie-chart to highlight the way that traffic reaches your site.

## 10.1.3 Content

Basically, this is a summary of the Google Analytics "Top Content" report. It displays the top 20 most viewed site pages, along with its specific metrics: pageviews, unique pageviews, average time on page, bounce rate and page exits.

## The purpose of this guide

This guide is designed to assist you, step by step, in configuring and Joomla! Pages using the [RSSeo! tool](#).

We've also created a RSSeo! Quick Guide, that includes all important steps that you must follow to be able to quickly configure and optimize your Joomla! Website.

Additionally, we've launched the [RSJoomla! TV Channel](#) to support our components with a series of video tutorials and presentations.

The RSSeo! Documentation can be found [here](#).

For any other questions, please submit a ticket to the [RSJoomla! support department](#).
